

Who Was To Blame? Not me!

WHO WAS
TO BLAME?

How often do you hear the words “Who was responsible? Someone must have been to blame” when you learn of a serious fire in the papers or on TV?

One of the most important ways to prevent the spread of fire and stop the blame game is to correctly specify, install, maintain and inspect fire doors. So if everyone involved in the life of a fire door recognised the potential consequences of their choices and actions, all fire doors would do their job in protecting property and human life.

Just another door?

Fire doors are the unsung heroes of fire safety. Most of the time they work just like any other door. But when a fire breaks out, they work as an engineered safety device. All the components have to work together to hold back the lethal spread of smoke and flame for a specified time to allow time for escape and for the fire service to do their job.

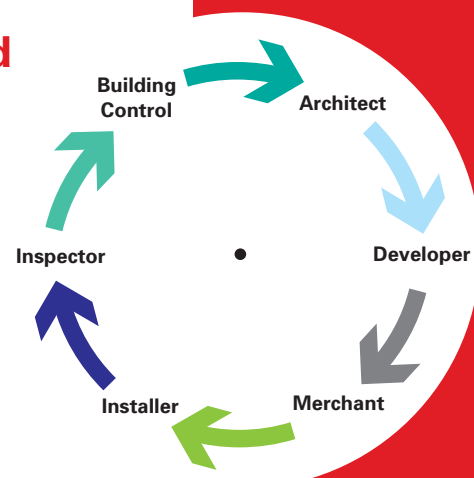

There's a surprising lack of awareness and understanding of fire doors and how they work, even amongst those who have dealt with and checked them for many years. And those responsible for specifying, buying, installing or inspecting them are not always aware that if the wrong components (for example, the wrong type of door closer) are used, the door's performance can be compromised.

This lack of understanding can lead to short cuts and penny-pinching. It's only when a fire breaks out that the potentially lethal consequences are realised, often with devastating results.

Who should ensure that fire doors are fitted and working correctly?

Because no one wants to take responsibility the lines become blurred through the various stages of the process, even through inspection.

The BWF-CERTIFIRE Scheme has developed the 'Circle of Blame', an easy way of describing the process that can lead to potentially lethal sub-standard fire doors. The term is intended to alert all those involved in the process to the fact that, without a definitive specification or recommendation right at the start, cost considerations, ignorance and quick fix solutions could override safety when it comes to decisions about fire doors. The 'Circle of Blame' stops everyone relying on the next person to get it right.

Each stage in the Circle is crucial. Here's what you can do.

The specifier

- Insist on third party certificated fire doors

Specifiers have the power to prevent decisions which might be based on cost, rather than safety, being taken further down the line by insisting upon third party certificated fire doors. With a wide range of third party certificated designs at competitive prices there is no reason not to set the standard at this all-important point in the decision-making process.

The merchant

- Only stock 3rd party accredited and certificated fire doors and components, including frames
- Ensure your staff are aware of their responsibilities when advising customers on fire safety
- Consider becoming a BWF Approved Fire Door Centre – contact us for details.

There are now around 100 BWF Approved Fire Door Centres at builders' merchants, with staff trained to understand fire doors, their components and the relevant building regulations. Every BWF Approved Fire Door Centre commits to stocking the right ranges of compatible fire door components. The BWF-CERTIFIRE Scheme also commits to keeping AFDCs up to date on changes in legislation and the industry.

The building control officer

- Check the frame is the right one for the door
- Check the closer is compatible. Does it close the door onto the latch in a controlled way?
- Check for the fire door label on the door
- Use the BWF Gaptester to ensure the door is fitted with the correct 3mm gaps all round the door.

Building Control Officers bear the final responsibility for checking and assessing fire doors, as part of the signing off procedure for a building. The only way to be absolutely sure that a fire door will do its job is if the assembly, as described in the original test report, is replicated.

The door fitter

- Make sure you have bought and fitted the correct, compatible components
- Check the label and the fitting instructions that come with the door
- If in doubt ASK. Contact the merchant or the manufacturer
- Pick up the BWF Builder's Guide at your local BWF Approved Fire Door Centre.

Door fitters need to ensure that the door matches the requirements on the architect's drawings, and complies with the building regulations. If a fire door is not fitted correctly, it is just an ordinary door.

The facilities manager

- Make sure you check fire doors regularly
- Check hinges, seals, closers and handles
- Visit the BWF website for access to useful resources including our information video and maintenance checklist
- Never leave fire doors propped open.

In line with recent legislation, facilities and office managers must ensure that fire doors are properly maintained. The BWF-CERTIFIRE Scheme recommends that fire door repairs are carried out only by BWF Licensed Converters who are able to maintain the certification of the fire door.

By adopting a circle of responsibility you involve everyone and ensure there are no compromises.

For more information, telephone 0870 458 6939, email firedoors@bwf.org.uk or visit the BWF website on www.bwf.org.uk.

British Woodworking Federation, 55 Tufton Street, London SW1P 3QL
t: 0870 458 6939 f: 0870 458 6949 e: firedoors@bwf.org.uk w: www.bwf.org.uk/firedoors

Fire door signage is required on both sides of any door located in a public building.
